WENZHOU-KEAN UNIVERSITY

AI-Driven Information Systems Innovation

1. Overview

The goal of this group project is to apply the concepts, frameworks, and analytical tools learned in class to analyze a company's **core** management information systems (MIS) and its role in supporting business strategy and value creation. Building on this analysis, the project requires proposing an **AI-driven solution** to transform and enhance the selected MIS.

Through this project, you will connect theory to practice by integrating strategic and technological perspectives, demonstrating how AI can transform MIS to create business value and competitive advantage.

Group Formation: Groups will be **randomly assigned** in class. There are 25 students in total, forming 5 groups of 5 students each. All deliverables are group-based. Separate assignments will be created in Canvas for each stage, and each group is required to submit **only one copy per stage** (i.e., proposal, presentation slides, final report).

Project Timeline

Stage	Deliverables	Deadline
Proposal	6–8 pages, 12pt, 1.5-line spacing	April 3 (Fri), 23:59
Presentation	20 min presentation + 5 min Q&A	April 12 (Sun), 09:00
Final Report	~15 pages, 12pt, 1.5-line spacing	April 18 (Sat), 23:59

2. Stage 1 – Proposal

Deadline: April 3 (Friday), 23:59 (Beijing Time)

Deliverable: A Word document (6–8 pages, Times New Roman, 12-point font, 1.5-line spacing) with page numbers, group information, a clear title, and well-organized sections.

Goal: Conduct a strategic and information system analysis of a real company using the frameworks and analytical tools learned in class.

Company Selection: Select a company you are familiar with or interested in. Companies where you have work or internship experience are recommended.

Scope and Focus: Most companies operate multiple products and information systems, so a clear focus is required. The strategic analysis should center on the company's primary product or service, while the information systems analysis should focus on **one core system** that supports key value-generating activities. For example, instead of broadly analyzing "Tencent's MIS," narrow the scope to a specific product and system, such as WeChat or QQ Music.

Data Sources: Use credible sources to support your analysis, such as company reports, public filings, academic articles, and reliable online materials. Do not use the fabricated statistics generated by AI.

Proposal Structure (suggested):

1) Introduction: Brief overview of the company and its core business.

2) Strategic Analysis: Apply relevant frameworks (e.g., *Five-Force, Value Chain, Resource-Based View, IS Strategy Triangle*) to analyze the competitive environment, key activities, and strategic resources.

3) Information System Analysis: Identify one core MIS. Explain its main functions, purpose, and role in supporting the company's strategy and evaluate its effectiveness in creating business value.

4) Challenges and Problem: Identify specific information system–related problems (not general management issues). Explain where they occur and why they matter. Propose **initial ideas** for how these problems could be addressed.

5) References: Use a consistent format (e.g., APA) for all references, including books, academic journals, online articles, blogs, etc.

3. Stage 2 – Presentation

Deadline: April 12 (Sunday), 09:00–12:00 (Beijing Time)

Deliverable: 20 min presentation + 5 min Q&A

Goal: Present Stage 1 insights and develop a focused AI-driven solution that directly addresses the identified problem.

Key Requirement (suggested):

1) Recap: Summarize key insights from Stage 1 – core business context, strategic analysis, information system analysis, challenges and problems
2) AI-Driven Solution: Clearly explain
    - The specific problem being addressed (concrete and well-defined)
    - What AI is applied and where it is integrated in the system
    - How the solution works: key data inputs, model logic (conceptual), workflow, and outputs
    - The expected business value, with a clear link to the problem (do not use fabricated statistics generated by AI!)

- Potential risks and relevant ethical or governance considerations

The solution should be realistic and appropriately scoped (e.g., recommendation systems, predictive analytics, NLP, automation). Avoid listing broad or multiple unrelated AI ideas.

4. Stage 3 – Final Report

Deadline: April 18 (Saturday), 23:59 (Beijing Time)

Deliverable: A Word document (~15 pages, Times New Roman, 12-point font, 1.5-line spacing) with page numbers, group information, a clear title and well-organized sections.

Goal: Deliver a cohesive and well-structured report that integrates the strategic analysis from stage 1 and the AI-driven solution from stage 2 into a clear and actionable proposal.

Report Structure (suggested):

1) Executive summary: Concise overview of the problem, proposed solution, and expected business value.
2) Company background: Overview of the company and its core business.
3) Strategic and Information System Analysis: Apply key frameworks (e.g., *Five Forces*, *Value Chain*, *Resource-Based View*, *IS Strategy Triangle*) to analyze the business context and the selected MIS.
4) Challenge/Problem definition: Clearly define the focal IS problem.
5) Proposed AI-Driven Solution: Clearly present a focused solution that directly addresses the identified problem, include:
    - AI application and system integration
    - How the solution works (data inputs, model logic, workflow, outputs)
    - Expected business value (avoid fabricated statistics generated by AI)
    - Risks and ethical/governance considerations
6) Conclusion and Managerial Implications
7) References

5. Academic Integrity and AI Use

- All submissions must comply with academic integrity standards. The Turnitin similarity score should be below 15%.
- Clearly disclose whether and how AI tools were used in completing your work (e.g., proposal, presentation, final report).
