Introduction to AI

From vague buzzword to managerial judgment

Dawei Chen

Day 4 · Morning · 10 May 2026

Where We Are

● Day 1 PM	What MIS Is	Definition, core activities, sociotechnical view of MIS
● Day 2	How MIS Creates Value	IS Strategy Triangle, Five Forces, Value Chain, RBV
● Day 3 AM	Digital Transformation	How MIS reshapes value creation, operations, and competition
● Day 3 PM	Who MIS Affects	Ethical and social issues: info right, accountability, property right, system quality, quality of life
● Day 4 AM	How AI Fits In	<i>AI in organizations: business value, adoption, human–AI role allocation</i>
○ Day 4 PM	How to Work with AI	4D AI Fluency Framework, prompts, skills, agents
○ Day 5	How to Think Strategically	Game theory and strategic thinking in digital markets

Learning Objectives

- | | | |
|-----------|--------------------------------------|--|
| 01 | Clarify the language | What do we mean when we say “AI”?
Model, application, workflow, outcome |
| 02 | Analyze business value | Where AI creates values, where it does not, and how to allocate work between humans and AI |
| 03 | Apply the lens to a real case | Use the Baidu intelligent recruitment case to practice AI adoption analysis |
| 04 | Bridge to your group project | Formulate a focused, realistic AI opportunity for your group project |

01

Clarify the language

What do we mean when we say “AI”?
Model, application, workflow, outcome

Warm-up

When people in your organization say “AI,” what do they usually mean?

- A chatbot or conversational tool?
- A prediction model?
- Automation of a task or workflow?
- Data analytics or reporting?
- A strategy slogan or vision?

1

In everyday conversation, “AI” may refer to a chatbot, an algorithm, a software feature, an automation workflow, or a strategic initiative.

2

That ambiguity creates weak analysis — the problem is unclear, the use case is unclear, and the expected value is unclear.

3

Managers should ask one discipline-building question: **what exactly is the AI here?**

What Is AI

“ An AI system is an engineered or machine-based system that can, for a given set of objectives, generate outputs such as predictions, recommendations, or decisions influencing real or virtual environments.

—— Adapted from [NIST AI RMF 1.0](#) / OECD

“ Artificial intelligence (AI) is a set of technologies that empowers computers to learn, reason, and perform a variety of advanced tasks in ways that used to require human intelligence, such as understanding language, analyzing data, and even providing helpful suggestions.

—— [Google Cloud](#)

AI should be discussed in relation to **objectives**, **outputs**, and **environments** — not as a magic tool.

What Is AI

Raw Data

Information

Images are regenerated by ChatGPT Thinking

Source: AI, Machine Learning, Deep Learning and Generative AI Explained

Machine Learning

How to learn? What pattern?

Learning patterns from data instead of following explicit rules

Linear Regression

Logistic Regression

Decision Trees

Random Forest

K-Nearest Neighbors

Support Vector Machines

Naive Bayes

K-Means Clustering

Neural Networks

Gradient Boosting

Generated by ChatGPT Thinking

Machine Learning

How to learn? What pattern?

Supervised Learning

Train on **labeled** data
to predict outcomes

Spam detection, credit scoring

Unsupervised Learning

Find hidden structure
in **unlabeled** data

*Customer segmentation, anomaly
detection*

Reinforcement Learning

Learn by trial and error with
rewards

Game playing, robotics, recommendation

Deep Learning

How to learn? What pattern?

Deep learning uses **neural networks** to learn complex patterns from large-scale data.

Spam Email Classification

Generated by Opus 4.6

A Managerial Layer View of AI

These technical methods matter only insofar as they shape what AI can do in practice.

Key Point

Managers rarely adopt “a model” in the abstract. They adopt an application or redesign a workflow in order to improve a business outcome.

Example: AI Chatbot

Where is the “AI” here? (model, workflow, or interface?)

Model

Language model produces summaries and draft responses

Application

Customer-service assistant embedded in an enterprise system

Workflow

Summarize complaints, suggest replies, route urgent cases

Outcome

Faster response, more consistency, lower workload

“ A chatbot is not the strategy. The real managerial question is **how the workflow changes** and whether that change **creates value**.

Talking About AI More Specifically

Prediction

Forecast demand, estimate risk, predict churn, anticipate no-shows

Recommendation

Suggest next best action, product, content, or intervention

Matching

Match people to jobs, leads to reps, or cases to experts

Generation

Draft text, summarize, translate, create first versions

Automation

Route requests, trigger steps, escalate exceptions

Managerial Discipline

We should use AI

We want to use AI for prediction, matching, generation, recommendation, automation in XXX workflow.

Quick Check: What Exactly Is the AI Here?

Case A

An HR system ranks résumés before a recruiter reviews them.

Case B

A bank flags potentially suspicious transactions in real time.

Case C

A sales team uses an assistant to draft follow-up emails after meetings.

Case D

A hospital predicts which patients are likely to miss appointments.

For each case: What is the output? What kind of AI work is being done? What workflow is being improved?

02

Analyze business value

The real question is not whether AI is impressive.

The question is Where AI creates values, where it does not, and how to allocate work between humans and AI

Why AI Matters Now for Managers

- 1 Models are stronger and more general-purpose than before.
- 2 AI is easier to access through everyday applications, not just specialist tools.
- 3 The current wave affects knowledge work, not only technical automation.
- 4 The managerial question is no longer whether people have heard of AI; **it is how work and judgment will be reorganized around it.**

AI is not only an IT topic. It affects process design, roles, expertise, coordination, governance, and the economics of decision making.

How AI Creates Business Value

Better Prediction

More accurate forecasting, scoring, or risk estimation.

Better Matching

More targeted pairing of people, products, content, or cases.

Faster Processing

Less time spent on search, summarization, or first drafts.

More Consistency

Reduced variation in repetitive decisions or communication.

New Possibilities

Personalization, new service models, or new analytical capability.

Important Qualifier

An AI tool does not create value by itself. Value comes when the tool improves a meaningful task, decision, handoff, or workflow.

Where AI Usually Fits Best

Better candidates for AI support

- High-volume and repetitive work
- Pattern recognition across large data
- Standardized screening or prioritization
- Summarization and information compression
- First-draft generation
- Routine matching or routing

More cautious / more human-led

- Ambiguous judgment with weak data
- Trust-sensitive communication
- Emotionally complex interaction
- Exception handling
- Value-laden or highly accountable decisions
- Final evaluation where context matters more than scale

A Simple Human–AI Role Allocation Lens

- 1 Repetitive or variable?** The more repetitive the task, the stronger the AI case.
- 2 Data-rich or context-heavy?** AI is stronger when there is enough structured signal to learn from.
- 3 How important is speed?** AI often helps most when time pressure matters.
- 4 How important is consistency?** Standardization often increases the value of AI assistance.
- 5 Cost of error?** The higher the downside, the stronger the need for human review.

Connect AI to task design, risk, and governance instead of hype.

AI Safety

[International AI Safety Report 2026](#)

The second International AI Safety Report, published in February 2026, is the next iteration of the comprehensive review of latest scientific research on the **capabilities and risks of general-purpose AI systems**.

AI Safety

Reliability

Hallucination, inconsistency, and non-deterministic outputs

Misuse

Deepfakes, automated scams, disinformation at scale

Fairness

Bias embedded in training data perpetuated by models

Autonomy Risk

Systems acting beyond intended scope or human control

Generated by ChatGPT Thinking

03

Apply the lens to a real case

Use the Baidu intelligent recruitment case to practice AI adoption analysis

Case: Baidu Intelligent Recruitment

Discussion Format

- Each group takes one focal question
- 12 minutes group discussion
- 1 slide + 2 min presentation per group
- 8 – 10 minutes synthesis

Required Output

Each group should prepare only 3 points:

- *Answer:* your group's conclusion
- *Reason:* why you think so, based on the case
- *Recommendation:* what Baidu should do next

Case: Baidu Intelligent Recruitment

- 1 Where does AI create the most value in Baidu's recruitment process?

- 2 Which recruitment tasks should be led by AI, and which should remain human-led?

- 3 What are the main risks or limitations of intelligent recruitment at Baidu?

- 4 Why might some firms resist intelligent recruitment, and how should Baidu or other firms manage adoption?

- 5 Looking beyond efficiency, what broader impact will intelligent recruitment have on jobs, organizations, and society?

Case: Baidu Intelligent Recruitment

Managerial Observation

AI is embedded across multiple tasks in the workflow—not just one stand-alone Chatbot or one dashboard.

Case: Baidu Intelligent Recruitment

What does the Baidu case teach us about AI adoption?

- 1 AI creates value when embedded in a specific workflow
- 2 Not all recruitment tasks should be treated the same
- 3 Good AI adoption requires role clarity between AI and humans
- 4 Implementation is not just technical; it is also organizational
- 5 Efficiency alone is not enough; firms must also consider fairness, trust, and job redesign

04

Bridge to your group project

A good AI opportunity is not “AI for company X.” It is “AI for this problem, in this workflow, to improve this outcome.”

Group Project

One company

A real company you can understand and analyze

One focal MIS

Not the whole organization; one important system or workflow

One specific problem

An IS-related pain point that clearly matters

Realistic AI adoption

Basic model logic, adoption, risks & limitations

Clear value

Better decision, speed, quality, or experience

*Your project is strongest when the AI idea is **focused**, **realistic**, and directly tied to a selected MIS and a **concrete problem** — not a list of unrelated AI possibilities.*

Group Project

Weak / too broad

- Tencent should use AI.
- Use ChatGPT to improve everything.
- Add AI customer service.
- Use AI to become more efficient.

Stronger / more project-worthy

- Use AI to improve WeChat merchant support ticket triage and routing.
- Use AI to predict inventory exceptions in a retailer's supply-chain MIS.
- Use AI to support insurance claims document review before human approval.
- Use AI matching to improve internal talent allocation in a recruitment workflow.

Managerial Takeaway

- 1 Do not ask, “How can we use AI?” Ask, “Where in this workflow can AI improve decision quality, speed, matching, or execution?”
- 2 AI adoption is not just a technology issue; it is also a management issue involving task design, human–AI role allocation, trust, and implementation
- 3 For your project, avoid broad AI ambition. Define one specific problem in one core MIS or workflow, then identify one focused and realistic AI opportunity
