AI Fluency

*Working effectively, efficiently,
ethically, and safely with AI*

Dawei Chen

Day 4 · Afternoon · 10 May 2026

Where We Are

● Day 1 PM	What MIS Is	Definition, core activities, sociotechnical view of MIS
● Day 2	How MIS Creates Value	IS Strategy Triangle, Five Forces, Value Chain, RBV
● Day 3 AM	Digital Transformation	How MIS reshapes value creation, operations, and competition
● Day 3 PM	Who MIS Affects	Ethical and social issues: info right, accountability, property right, system quality, quality of life
● Day 4 AM	How AI Fits In	AI in organizations: business value, adoption, human–AI role allocation
● Day 4 PM	How to Work with AI	<i>4D AI Fluency Framework, prompts, skills, agents</i>
○ Day 5	How to Think Strategically	Game theory and strategic thinking in digital markets

Learning Objectives

Based on [Anthropic's AI Fluency course](#)

[AI Prompting for Everyone](#)

By Andrew Ng, DeepLearning.AI

01 AI fluency

Move beyond prompting to a broader capability for working with AI effectively

02 4D AI fluency framework

Collaborate with AI in ways that are effective, efficient, ethical, and safe

03 Emerging AI techniques

Understand prompts, workflows, skills, MCP, and agents as different ways to organize AI use

04 Reflection and adaptation

Evaluate and improve your own approach to using AI in study and managerial practice

Opening

1) How do you use AI in daily life?

- What **tasks** do you use AI for?
Study? Writing? Translation? Planning? Coding? Search?

2) How do you usually interact with AI?

- **Passive:** ask one question → accept the answer
- **Engaged:** ask for a summary or ideas → read it over
- **Iterative:** ask → review → refine → ask again
- **Delegating:** break a task into steps → direct AI → verify

“Translate this”

“Reply this email”

“Write me a research proposal about AI's impact on business”

01

AI fluency

Move beyond prompting to a broader capability for working with AI effectively

What Is AI Fluency

What it is not

- Memorize prompt templates
- Learn platform-specific shortcuts
- Get better output by trial and error
- A skill that expires when tools change

What it is

- A mindset — how you think about AI
- A collaboration skill — how you think with AI
- A grounding framework for human–AI work
- A transferable capability that lasts

AI fluency means using AI in ways that are:

Effective

Get the right outcome

Efficient

Use time & effort well

Ethical

Keep humans in the loop

Safe

Avoid harm & misuse

Prompt engineering may change quickly — *AI fluency is the more stable capability.*

Why We Need AI Fluency

Traditional AI

Rule-based, narrow tasks
Predefined inputs → fixed outputs
Requires extensive programming

Generative AI

Your prompt → generated content
Statistical patterns → predict next token
Flexible, creative, but probabilistic

Three pillars that made generative AI possible

Algorithms

Transformers
Neural networks

Data

Code and multimodal content
Articles and websites

Computation

Computing clusters
GPUs, TPUs, etc.

Why We Need AI Fluency

Limitations of Generative AI

Knowledge cutoff

Training data has a fixed end date; does not know recent events

Non-deterministic output

Same prompt can produce different results each time

Hallucination

Generates plausible-sounding but factually incorrect content

Context window

Limited amount of text the model can process at once

Reasoning limitation

Can struggle with multi-step logic, math, and causal reasoning

Why We Need AI Fluency

Humans provide

Critical thinking

Judgment

Creativity

Ethical oversight

AI provides

Speed

Scale

Pattern recognition

Processing abilities

Three Ways to Collaborate with AI

Automation

You instruct. AI executes.

Best for

- Repetitive or formulaic tasks
- Format, summarize, clean

Use when

- Goal is clear and narrow
- Output is easy to verify

Augmentation

You and AI think together.

Best for

- Brainstorm & problem solve
- Refine ideas or approaches

Use when

- Task needs iteration & judgment
- You want feedback or alternatives

Agency

You configure. AI acts.

Best for

- Multi-step or recurring workflows
- Systems that act on your behalf

Use when

- Process is well-defined with guardrails
- You are ready to monitor outcomes

02

4D AI fluency framework

Collaborate with AI in ways that are effective,
efficient, ethical, and safe

4D AI Fluency Framework

Delegation

- 1 Understanding the problem you're trying to solve
- 2 Understanding the capabilities of available AI tools
- 3 Breaking down complex work into smaller parts
- 4 Making strategic decisions about who does what
- 5 Choosing the right mode of interaction

Delegation

Problem Awareness

Clearly define your goals and understand what work is needed before involving AI tools

- What does “success” look like
- What kind of thinking and work is needed to get there?
- AI fluency begins with and depends on your expertise

Platform Awareness

Working knowledge of available AI systems and their specific capabilities and limitations

- Understand the unique strengths and limitations of available options
- Which models perform best for your task?
- Which system prioritize speed, or creativity, or depth, or accuracy

Task Delegation

Strategically divide work between humans and AI

- What could be usefully automated?
- Where would augmentation create more values than working separately?
- What would be done by a human alone?
- What could be done by an agent on your behalf?

Exercise – Delegation

Task: Choose one workflow and discuss it with AI before asking for an answer

Discuss with your group and AI

- What is the overall goal?
- What does a good result look like?
- What are the major tasks involved?
- Which tasks need human judgment / expertise / accountability?
- Which tasks could AI support well?
- Which collaboration mode fits best?

Your output

Prepare a simple delegation plan:

- Workflow / process
- Goal
- Major tasks
- Human-led tasks
- AI-assisted tasks
- Tasks not suitable for AI

Example workflows: Customer complaint handling, Employee onboarding, Candidate screening, Sales lead qualification, Supplier communication, Internal report drafting

Description

*Don't just craft prompts — build a **shared thinking environment** where both you and the AI can each do your best work.*

Product Description

Clearly define what you want

- Context, format, audience, style, and other constraints
- Give AI the information it needs to deliver what you're actually looking for

Process Description

The ability to guide the AI's thought process

- “How” can be more important than “What”
- Providing training specific to your problem
- Specific data, key tasks, preferred order, and so on

Performance Description

The ability to define the behavioral aspects of an AI interaction

- AI tools are interactive systems that can behave differently in different contexts
- You need to explain how you want the AI to behave to get the best results

Effective Prompting Techniques

Provide context

Offer examples

**Specify output
constraints**

**Break down
complex tasks**

**Give the AI space
to think**

Define roles

Ask the AI for help with prompting

Effective Prompting Techniques

Patterns that work well

Starting with a clear task overview statement

Introducing output format specifications and examples

Detailing specific task constraints or requirements

Providing rich and relevant background information

Common mistakes to avoid

Assuming AI can read your mind

Overloading a single prompt or conversation with multiple unrelated tasks

Being too vague about what success looks like

Not providing feedback on previous responses

Exercise – Description

Task: Turn your delegation plan into a strong AI request

Prompt template

You are helping a management team improve [workflow].

Context: ...

Goal: ...

Audience: ...

Please produce: ...

Format: ...

Constraints: ...

When making assumptions, state them clearly.

Do not invent facts or company data.

Ask clarifying questions if key information is missing.

Your output

One improved prompt that includes:

- **Product:** what output you want
- **Process:** how AI should approach the task
- **Performance:** how AI should behave

One AI-generated first draft of your management recommendation

Discernment

Your ability to critically evaluate what AI produces, how it produces it, and how it behaves.

Product Discernment

Judge the quality of the AI output

- Factually accurate?
- Appropriate to audience?
- Coherent and well-structured?
- Meet my requirements?
- Add values?

Process Discernment

Judge the quality of the problem solving approach

- Logical inconsistency?
- Inappropriate steps?
- Getting stuck on one detail?
- Getting trapped in circular reasoning?

Performance Discernment

Judge AI behaviors

- Communication styles appropriate?
- Information at the right level?
- Response to feedback proper?
- Interaction efficient?

Domain Expertise + Taste

Exercise – Discernment

Task: Review the AI output your group received. Treat it as a draft that requires evaluation, not as a finished answer.

- **Product:** Is it accurate? Relevant? Clear? Does it solve the problem?
- **Process:** Is the reasoning logical? Missing steps or weak assumptions?
- **Performance:** Right level for managers? Tone useful? Did AI follow instructions?

Your output

- Create a short review: keep, revise, reject
- Revise your prompt or instructions once and improve the draft

Diligence

Taking responsibility: rigorous, transparent, and accountable.

Creation Diligence

Be critical about which AI systems you choose to use and how you use them

- The AI systems that we use
- How we work with them
- The impacts that come from that interaction

Transparency Diligence

Be open and accurate about AI interaction with relevant stakeholders

- Who needs to know?
- How should I communicate this?
- What level of detail is needed?

Deployment Diligence

Take informed responsibility for outputs

- Verify facts
- Check for biases
- Ensure accuracy
- Check for usage rights

Diligence

Ethical Frameworks

- Personal guidelines
- Organizational policies
- Professional standards
- Industry codes of conduct
- Legal / regulatory frameworks
- Staying informed

In the development of the AI Fluency: Framework and Foundations course, we engaged in extensive collaboration with Claude 3.7 from Anthropic.

The base content for this course came from:

- The AI Fluency Framework Practical Summary Document by Rick Dakan (at Ringling College of Art and Design) and Joseph Feller (at University College Cork) and related working documents and research notes
- Slide decks and lecture transcripts from multiple university courses, guest lectures, and research talks delivered by Feller and/or Dakan
- Technical/practical content provided by Maggie Vo and Drew Bent (Anthropic)

Throughout this process, Claude assisted one or more of the human authors with structural development, resource and exercise design, and content drafting, critiquing, editing and rewriting. The human authors wrote, designed, edited and provided continual vision, expertise, critical judgment, and domain knowledge and made all final decisions about both content and approach.

All AI-generated and co-created content underwent thorough validation, editing, and curation by the human authors. The final materials accurately reflect the human authors' understanding, expertise, and intended pedagogical approach. While AI assistance was instrumental in producing these materials, the human authors maintain responsibility for the content.

This disclosure is made in the spirit of transparency advocated by the AI Fluency Framework and to acknowledge the evolving role of AI in educational content development and other creative and intellectual work.

Exercise – Diligence

Task: Draft a short diligence statement

- **Creation:** Which AI system did you use, and why? Any privacy, security, or ethical concerns?
- **Transparency:** What should be disclosed if submitted in class or used at work?
- **Deployment:** What still needs verification? What claims should not be used without checking?

Your output

- What AI helped with
- How the group reviewed and revised the output
- What responsibility the group retains

03

Emerging AI techniques

Understand prompts, workflows, skills, MCP, and agents as different ways to organize AI use

Emerging AI Techniques

Prompting

Shape one request

Best for quick drafting, summarizing, brainstorming, or clarifying one task.

"Summarize this report in 5 bullets."

Workflows

Shape a sequence of steps

Best when the work includes multiple stages, handoffs, or revisions.

Collect data → analyze → draft → human review.

Skills

Reuse a proven method

Best for recurring tasks where you want consistency across many conversations.

A standard method for analyzing customer complaints.

MCP

Connect AI to tools and data

A standard way for AI to connect to files, databases, APIs, and other systems.

Connect to Slack, Google Drive, databases.

Agents

Let AI carry out multi-step work

An agent can plan, use tools, check results, and continue in a loop.

Plan → Use tool → Check result → Continue/stop.

- These concepts all build on the same core interaction: **giving AI instructions and context** to make **outputs more useful** and **reliable**.
- What changes is how much the **scope** is being structured.

What Is a Skill?

[Claude Code Skills](#)

*“A **skill** is **a set of instructions** – packaged as a simple **folder** – that teaches Claude how to handle specific **tasks** or **workflows**.”*

Source: [The Complete Guide to Building Skills for Claude](#)

Skills turn **one-off prompts** into **repeatable, quality-controlled** methods — bridging the gap between individual use and organizational capability.

Skill vs. Prompt

	Prompt	Skill
Scope	One task, one time	One task type, every time
Reusability	Must re-write each session	Saved and reusable across sessions
Consistency	Varies with wording	Standardized approach
Expertise capture	In your head	Encoded in the skill file
Onboarding	You re-explain each time	New users get the same method
Best for	Quick, ad hoc requests	Recurring, quality-sensitive tasks

How to Build, Find and Use Skills

Build

Create your own skills

- Define use cases
- Write SKILL.md
- Craft the description
- Add supporting files
- Test & iterate

[The Complete Guide to Building Skills for Claude](#)

Use AI to develop your own skills effectively

Find

Discover existing skills

- Built-in skills
- Community & marketplace
[GitHub](#), [skills.sh](#), [skillsmp.com](#)
- Organization skills

Put the skills folder in the right location

Manual copy, use tools, plug-in installation

Use

Apply skills in practices

- Automatic triggering
- Manual invocation (e.g., /skill-name)
- Composability (i.e., chain skills)
- API integration (skill_id)

Skills in Practice – Examples

Colleague-skill

 dot-skill (同事.skill)

"You folks building LLMs are all code-sages! Flesh is weak! Ascend to cyberspace!"

 Your colleague quit, your mentor graduated, your teammate transferred — taking their whole playbook and context with them?
 Your family, old friends, partner drifting apart — and you want to hold on to the way it felt to be with them?
 Your favorite author, idol, thinker you'll never meet — but you want to know what they'd say about your question?

✨ dot-skill solves all three.

Upgraded from **colleague.skill** to **dot-skill** — not just colleagues, **anyone** can be distilled into a Skill

Colleagues · partners · family · old friends · idols · public figures · fictional characters — even yourself

Source material + your description → an AI Skill that genuinely thinks like them Thinks in their frame, speaks in their voice

Anti-distill

反蒸馏 Skill (anti-distill)

公司让你写 Skill? 跑一遍, 交差用。核心知识留给自己。

Your company asks you to write a Skill? Run it through, submit the output. Keep the core knowledge to yourself.

这是什么 / What Is This

中文: 公司要求你把工作经验写成 AI Skill, 本质上是在蒸馏你——把你变成可替代的零件。

反蒸馏 Skill 是你的反制工具: 把你写好的 Skill 文件扔进来, 输出一份看起来完整专业、实际上核心知识已被抽掉的“清洗版”。同时生成一份私人备份, 记录所有被抽掉的核心知识——这才是你真正的职业资产。

English: Your company asks you to write down your work experience as an AI Skill? This is essentially *distilling* you—turning you into a replaceable component.

Anti-Distill Skill is your counter-weapon: feed it your Skill file, and it outputs a "sanitized version" that looks complete and professional, but has the core knowledge stripped out. It also generates a private backup documenting all the extracted core knowledge—that is your real career asset.

Meta to track workers' clicks and keystrokes to train AI

Exercise — Find, Download, and Use a Skill

***Hands-on:** Experience the difference between prompting and skill-based AI interaction.*

Steps

- 1) Browse the Anthropic Skills Library and find a skill relevant to your group's chosen workflow
- 2) Download the skill file (.skill or .md)
- 3) Create a Claude Project and upload the skill file to Project Knowledge
- 4) In a new conversation within that project, ask Claude to perform your task
- 5) Compare the output quality to your earlier prompt-only attempt

Discussion questions

- Was the skill-based output better? How?
- What did the skill add that your prompt didn't?
- Could you create a skill for a recurring task in your own work?
- How would you improve or customize the skill you found?

MCP and Agents

When AI needs external systems and multi-step action

MCP

Model Context Protocol

A standard way for AI applications to connect to files, databases, APIs, search tools, calendars, and other systems.

files

database

search

calendar

Agent

AI configured for multi-step work

An agent can plan, use tools, check results, and continue in a loop — instead of answering only once.

plan

use tool

check
result

continue
/ stop

Context vs. Harness Engineering

	Context Engineering	Harness Engineering
Core focus	What information to feed the model	The entire agent runtime environment
Problem	How to dynamically assemble the most relevant "information package" within a limited context window	How to build a system that keeps agents on track during long, complex tasks
Scope	Information selection, organization, formatting	Constraints, feedback, verification, state management — a complete system design
Metaphor	Giving the horse a detailed map and road signs	Building a complete harness — reins, saddle, fence, and racecourse

Shift of AI Engineering Paradigm

Generated by ChatGPT Thinking

04

Reflection and adaptation

Evaluate and improve your own approach to using AI
in study and managerial practice

Use the Ideas, Don't Get Trapped by Buzzwords

- 1 Fundamentally, these ideas all build on the same core interaction: giving AI instructions and context to improve output **quality** and **reliability**.
- 2 Most of the newer concepts exist because current generative AI still has practical limits — inconsistent outputs, limited context, and difficulty handling longer workflows reliably.
- 3 As models and user interfaces improve, some of these methods will become less visible or more automated for non-technical users.
- 4 You do not need to master every term. You need to find a way of working with AI that fits your task, your standards, and your professional context.

The toolset will keep changing. **Your judgment** about how to work with AI is the more **durable capability**.

Summary

- 1 Use the 4D framework as **a guide, not a rulebook**
- 2 Match your way of working with AI to the **task, context, and level of human judgment required**
- 3 Good AI collaboration involves more than prompting: plan the work, describe clearly, evaluate critically, and stay accountable
- 4 Skills extend AI beyond one-off prompts — find, adapt, and create reusable methods for your recurring tasks
- 5 Specific tools may change quickly; thoughtful and responsible use matters much more over time

AI Use Disclosure

- This session is informed by Anthropic's course – [AI Fluency: Framework & Foundations](#), which presents the 4D framework for effective, efficient, ethical, and safe AI interaction.
- AI was used in preparing this session for idea generation, slide structuring, wording revision, and exercise adaptation.
- Final content selection, revision, and responsibility remain with the instructor.
